

# Bioinformatics for COVID19

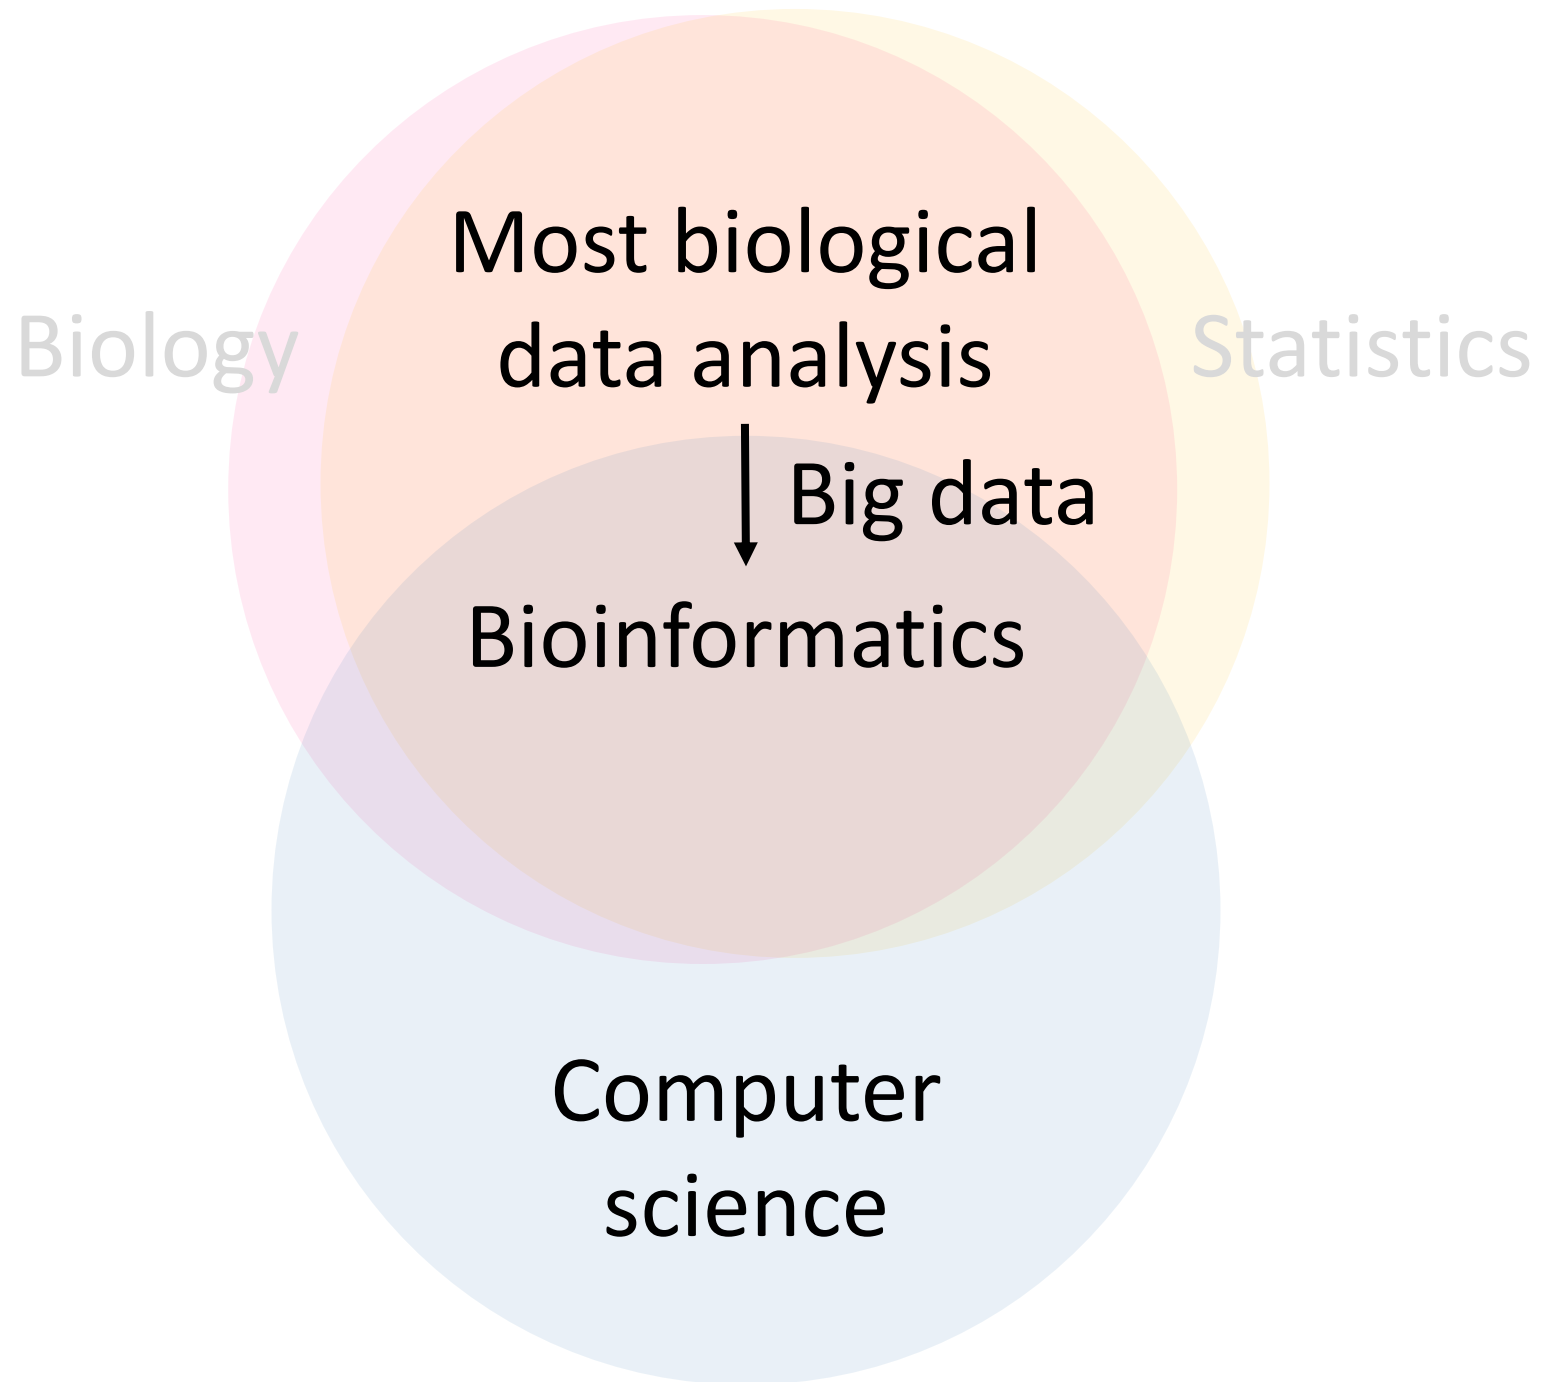

Kim Dill-McFarland

2021.05.18

[kadm@uw.edu](mailto:kadm@uw.edu) @kdillmcfarland

# Goal

Build a bioinformatic pipeline to efficiently and reproducibly analyze Respiratory Pathogen ID/AMR Panel sequences

# Specific aims

- Generate COVID19 consensus genomes for upload to public database
- Track variants of interest and variants of concern
- Track co-infections
- Create phylogenetic trees to
  - Track local variants
  - Identify local outbreaks
- Create reproducible, informative reports

Building a pipeline:  
Consider the data

# Respiratory Pathogen ID/AMR Panel (RPIP)

- Targeted sequencing of
  - All genes in SARS-CoV-2
  - All genes in influenza A/B
  - Identifying genes for 180 bacteria, 50 fungi, 40 viruses
  - Identifying genes for 1200 antimicrobial resistance markers
- Sequences from MiniSeq
  - 7 million (mid)
  - 20 million (rapid)
  - 22 million (high)

# Raw data

.fastq

@SRR001666.1

Building a pipeline:  
Outline a workflow

Building a pipeline:  
Research software

# Software considerations

## 0. Usefulness

- Does it do what you need it to do?

## 1. Documentation

- Manuals, tutorials, GitHub
- Open-source or black box

## 2. Cost

- Ownership vs annual membership vs cost-per-use

## 3. Platform

- Local (Windows, Mac, Linux), cloud, web
- Command line, graphical user interface (GUI), hybrid

# Specific aims

- Generate COVID19 consensus genomes for upload to public database
- Track variants of interest and variants of concern
  - How often does it update the global database?
- Track co-infections
- Create phylogenetic trees to
  - Track local variants
  - Identify local outbreaks
- Create reproducible, informative reports
  - How will software updates impact results?

# Building a consensus genome

# Errors in consensus

- Real or sequencing error? → PhiX control DNA
- If it's real...
  - IUPAC codes for uncertainty → R = A/G, N = ACTG, etc
  - Mixed population

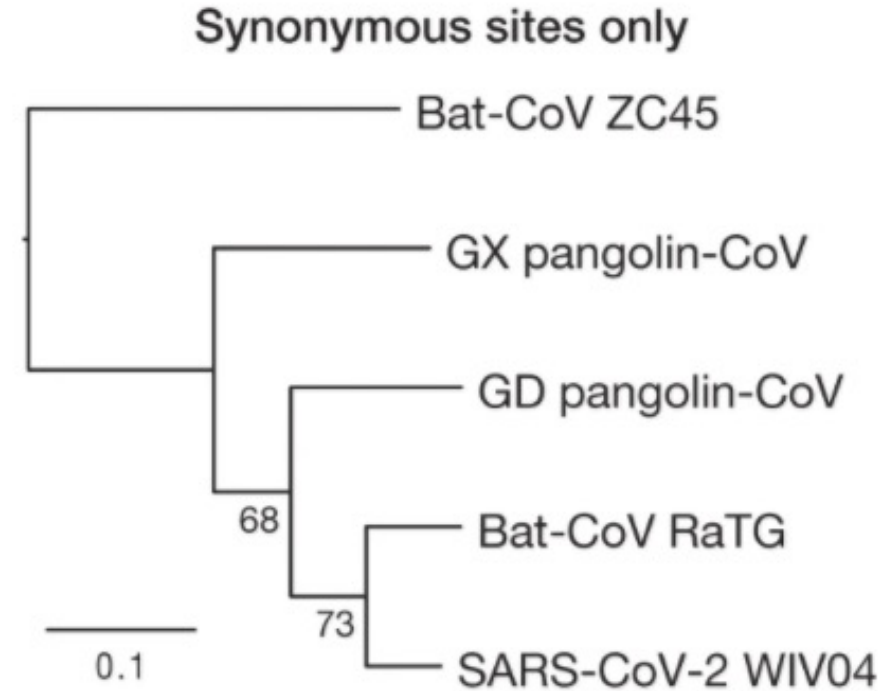

# Variant calling

- Compare to database with variants of interest/concern
- Usually translated alignment

Bat-CoV ZC45	N	I	T	N	V	C	P	F	H	K	V	F	N	A	T	R	F	P	S	V	Y	A	W	E	R	T	K	I	S	D	C	I	A	D	Y	T	V	F	Y	N	S	T	S	F	S	T	F	K	C	Y	376

# Phylogenetic tree

- Based on translated alignment
- Groups more similar “species”

# NextStrain

<https://nextstrain.org/ncov/north-america>

Building a pipeline:  
Putting it all together

# Pipeline wrappers

- Custom executable script
  - Short input in command line like `my_pipeline.sh data.fastq`
  - Download data + databases and run locally
- Web-based workflows (Terra Bio, Shiny apps)
  - Run executable script in the cloud
  - Data + databases can also be stored in the cloud
- Hybrid with IDbyDNA
  - Most steps on web
  - Download consensus sequence
  - Trees run locally, web, or cloud

# Next steps

- Decide on desired pipeline format (platform, wrapper, cost, etc)
- Build and test pipeline on pilot data

# Addtl resources

- NextStrain <https://nextstrain.org/>
- Shiny apps <https://shiny.rstudio.com/gallery/>
- Terra Bio <https://terra.bio/>
  - Example workflow usage
